**EXAMINER'S STATEMENT FOR REASONS OF ALLOWANCE**

***Amendments & Claim Status***

[1] This office action is responsive to Response Under 37 C.F.R. § 1.116, After Final received on Jan. 15, 2009. Claims 1, 10-13, and 16 remain pending; claims 2-9 and 14-15 cancelled; claim 16 new.

***Allowable Subject Matter***

[2] **Claims 1, 10-13, and 16** allowed.

[3] The following is a statement of reasons for the indication of allowable subject matter:

Regarding **claim 1**, while the prior art teaches a multi-layered real-time stereo matching apparatus-comprising: a left and a right image acquisition unit for obtaining a left and a right image of an object on a spatial area from different positions; an image processing unit for converting the left and the right image to a left and a right digital image; and a multi-layered image matching unit, which includes a systolic array, for comparing one scan line in one of the left and the right digital image with multiple scan lines in the other of the left and the right digital image in real-time by using the systolic array so that each pixel in the one scan line matches another pixel in the multiple scan lines in the other digital image, wherein said left and right digital images are left and right images of said object, and wherein matching the pixel in the one scan line with another pixel in the multiple scan lines enables location of the object in said spatial area so that the imprecision in location and direction of, or distortion caused by, said left and right image unit is prevented,

the prior art does not teach a multi-layered real-time stereo matching apparatus comprising: a left and a right image acquisition unit for obtaining a left and a right image of an object on a spatial area from different positions; an image processing unit for converting the left and the right image to a left and a right digital image; and a multi-layered image matching unit, which includes a systolic array, for comparing one scan line in one of the left and the right digital image with multiple scan lines in the other of the left and the right digital image in real-time by using the systolic array so that each pixel in the one scan line matches another pixel in the multiple scan lines in the other digital image, wherein the multi-layered image matching-unit

receives pixels of the one scan line in the one digital image sequentially and receives pixels of the multiple scan lines in the other digital image at a time, and calculates a disparity between one pixel in the one scan line and said another pixel in the multiple scan lines, wherein the systolic array includes a plurality of layers for receiving pixel data of the one scan line in the one digital image and receiving pixel data of the multiple scan lines in the other digital image one by one, wherein two adjacent layers exchange costs and active signals with each other and the multi layered image matching unit further includes an accumulator for accumulating data fed from the layers to generate the disparity, wherein each of the layers has: a first storing unit for storing pixels of the left digital a second storing unit for storing pixels of the right digital image; and a plurality of forward processors, stacks and backward processors for generating decision values and the disparity obtained from the left and the right digital image based on a clock wherein each of the backward processors of said each of the layers includes: an OR gate for logically summing two active bit paths inputted from an upper and a lower backward processor in said each of the layers, two active bit paths inputted from an upper and a lower layer of said each of the layers and a recursive active bit path within said each of the backward processors to generate a logical sum of five active bit paths; an activation register for storing the logical sum of five active bit paths; a demultiplexor for demultiplexing the logical sum of five active bit paths based on a decision value fed from the stack; and a tri-state buffer for outputting the decision value in case the logical sum of five active bit paths in the activation register is high, and wherein said left and right digital images are left and right images of said object, and wherein matching the pixel in the one scan line with another pixel in the multiple scan lines enables location of the object in said spatial area so that the imprecision in location and direction of, or distortion caused by, said left and right image acquisition unit is prevented.

**Claims 10-13 and 16** allowed by dependency.
